PRESS RELEASE

Luxury Gas Fire Controls From Teddington Appliance Controls.

The GBR (Gas Battery Remote) is a state of the art system for the remote control of domestic gas fires. The Remote control option enables control of the appliance from the comfort of your arm chair off; high and low flame positions are all made available from the hand set and for greater comfort the GBR features adjustable high/low timings. It adds an appealing feature to high end gas fires and can be particularly beneficial to the elderly or disabled.

The battery life will provide three starts a day for more than 675 days from standard batteries (if it is switched off when fire not in use). That is more than 2000 ignitions from a set of alkaline batteries.

The GBR has an output, on high flow, of 429 litres/hour air at a 1 mbar pressure drop (6.5kW on Natural Gas). The output on low flow is adjustable from 0 to 60% of the full flow. The maximum allowed temperature at the installation position is 70°C

The GBR is easy to use it also has a sophisticated fault reporting system, which provides tone codes in response to key presses on the remote control unit.

The GBR is only available to appliance manufacturers, who will need to obtain regulatory certification of their appliance, with the GBR fitted. The GBR is certified under EC/03/024.
