### **PRESS RELEASE**

#### **Teddington Appliance Controls New Power Flue Extraction System.**

A new flue extraction system that brings almost unlimited flexibility to the siting of domestic gas or oil-fired appliances will be demonstrated on the Teddington Appliance Controls stand (B7) at the Hearth & Home Exhibition in Harrogate (June 8-10).

The Teddington 42V, 75V Power Flue systems are intended for use with domestic gas or oil fired appliances that do not have a conventional flue. They allow you're a fireplace to be sited virtually anywhere, against an internal or external wall, in a corner, or as a room divider, using virtually any style of appliance. This gives householders maximum flexibility when designing their homes.

Designed to very high standards of quality and efficiency, the fans are constructed from galvanised sheet metal with stainless steel wall plates and fitted with a centrifugal impeller style fan that is highly resistant to dirt in the flue gases. The fan speed control is mounted on the PCB unit which is housed above the fan motor. The fan flue system is powered from 230V a.c. mains.

The Teddington system will accommodate flue runs of up to 6m with two 90° bends for most appliances. Sound levels are up to 55 dBa at 1 metre.
